

THE BILLFISH FOUNDATION'S

2014 INTERNATIONAL BILLFISH CONSERVATION RECORD

BISBEE'S FISH & WILDLIFE
CONSERVATION FUND

2013 Tag & Release Program Sponsors

INVESTING IN SPORTFISHING CONSERVATION

BISBEE'S FISH & WILDLIFE CONSERVATION FUND (BFWCF) works to conserve, restore, and manage fish, wildlife, and their habitats through science, education, and technology. BFWCF's mission to have thriving fish populations in natural habitats will ensure today's and future generations fishing success. Their contributions to The Billfish Foundation (TBF) helps further the understanding of the feeding, spawning, and migration patterns of billfish.

CASA VIEJA LODGE, located on Guatemala's Pacific coast provides anglers with an unbelievable resort experience and a modern fleet for fishing some of the world's most productive billfish waters. Its location and resources put Casa Vieja Lodge in a unique position to contribute a large amount of valuable tag & release data to TBF. Casa Vieja Lodge practices responsible conservation techniques so future anglers can have the same special experiences as those of today.

COSTA SUNGLASSES, a long-standing partner of TBF, believes that conservation is all about sustainable fishing. Many fish stocks that should be vibrant and healthy have fallen victim to poor fishing practices, unregulated development, lack of watershed protection or all of the above. Costa works with partners around the world, like TBF, to help increase awareness and influence policy so that both the fish and anglers of tomorrow will have healthy waters and fish populations to enjoy.

KING SAILFISH MOUNTS, TBF's longest-standing program partner, introduced and began promoting the release mount concept for Atlantic sailfish in the 1990's and quickly gained momentum as an alternative to traditional taxidermy. King Sailfish Mounts is now the industry leader and is the most influential producer of release mounts in the taxidermy industry. King Sailfish recognizes the importance of TBF's Tag & Release program and the importance of the data generated for managing and conserving billfish and other pelagic species.

PELAGIC GEAR's partnership with TBF meshes perfectly with the company's Pelagic Ocean Conservancy Project (POCP). The POCP supports scientific research, conservation, and recreational fisheries management, as well as, providing a voice for a large number of ocean enthusiasts. Pelagic and the POCP consists of responsible, conservation-minded sportsmen and active stewards of the sea who want to see the tradition of sportfishing survive for future generations to enjoy.

THE BILLFISH FOUNDATION'S 2014 INTERNATIONAL BILLFISH CONSERVATION RECORD ANALYZING 2013 TAG & RELEASE DATA

This publication is dedicated to the late Dr. Russell Nelson, a nationally acclaimed scientist, who served as The Billfish Foundation's (TBF) Chief Scientist for 12 years. His legacy and passion will live on through the realization of his vision for healthy fish stocks & thrilling fishing opportunities.

This publication is made possible by the generosity of:

**BISBEE'S FISH & WILDLIFE
CONSERVATION FUND**

2013 The Billfish Foundation Tag & Release Program sponsors:

President's Message

Dear TBF Members & Friends,

Thank you for your important contributions that made this annual report a reality; for it is your tag, release and recapture data that provides the substance and the detail upon which improved billfish conservation grows. The listing of your name in this publication is a testament of your support for responsible fishing and billfish conservation. The program sponsors distinguish their businesses from others by giving back to the great billfish upon which their business, tournaments and other activities depend.

Each year someone asks whether traditional tagging should continue? The overwhelming answer is a resounding YES. The “scientific tagging gold” comes through the recapture data you report and it is from that information that scientists are able to draw answers to a wide range of queries. Traditional tags remain on fish longer than the current satellite tag’s batteries allow those tags to stay on fish and collect data. The cost of traditional tags is a fraction of the cost of one satellite tag and is easily transportable by anglers to destinations around the world, including some of the regions where few tags have been deployed.

Those entering your own data direct into our new database system are doubling your conservation contribution; for self-entry saves staff time, reduces mistakes and speeds up the processing of your release certificate. If you haven't already, please check out the new database online at www.tagbillfish.org and start entering your data!

Without your support, TBF's ability to achieve successes today is greatly limited and that limits our collective sportfishing conservation legacy to future generations. It is an honor to have you on the TBF Team, please sign up a billfishing friend so we can continue advancing responsible sportfishing, sustainable stocks of fish, healthy oceans and strong economic returns to related businesses.

Best fishing,

A handwritten signature in blue ink that reads "Ellen Peel". The signature is written in a cursive, flowing style.

Ellen Peel
President

2013 Rybovich Lifetime Achievement Award

The Billfish Foundation's Rybovich Lifetime Conservation Award—named in honor of the late John Rybovich, a pioneer in billfish conservation and former member of TBF's Board of Directors—is this organization's highest award. This award is presented, at TBF's Annual Gala, to members of the sportfishing community who have excelled in their contributions to billfish and other marine gamefish conservation, as well as, to the associated sportfishing and boating industries. The 2013 award winners, Maumus Claverie, Jr., Captain Ron Hamlin and Eddie Smith, Jr., have all made outstanding contributions.

Maumus Claverie, Jr. of New Orleans, Louisiana has an extensive record of service in domestic and international fishery management, including serving on the Gulf of Mexico Fishery Management Council, the National Marine Fisheries Service Advisory Committee for Highly Migratory Species and the U.S. Advisory Committee for the International Commission for the Conservation of Atlantic Tunas. He also served on the Board of Directors of TBF.

Captain Ron Hamlin of Stuart, Florida is well-known for his expertise at the helm of a sportfishing boat, racking up awards, including multiple TBF Tag and Release honors, and recognition for his superb skill in placing anglers on billfish. He is one of the few who initially recognized the conservation benefits of non-offset circle hooks with natural baits, which he supported vigorously in the United States and in Central America where he fished for years.

Eddie Smith, Jr. of Greenville, North Carolina, owner and CEO of Grady-White Boats, has devoted his life to designing and building outstanding fiberglass boats with an understanding of the importance of the ocean and fish conservation to the future of the industry. If there are no fish, customers would soon turn to other interests. Over the years, Smith has given of both his time and energy by taking active roles with numerous recreational fish conservation organizations.

Dedication: Dr. Russell Nelson

Dr. Russell Nelson, a nationally acclaimed scientist who served as The Billfish Foundation's Chief Scientist for the past 12 years, passed away unexpectedly on October 5, 2013.

Nelson earned his undergraduate degree from the University of North Carolina, before earning a Ph.D. in zoology, fisheries ecology and statistics from North Carolina State University. While serving as Director of the Florida Marine Fisheries Commission (MFC) he established a solid record of success for the marine resources off Florida's shores. Former MFC assistant executive director Roy Williams said, "He was well-educated; he was one of those guys, like Einstein, who had pathways through the brain the rest of us didn't have. He was a good scientist but he also had pretty good political insight. Most of the issues we dealt with were tough, because you had to

say 'No' to somebody. He was good because he could balance the science and the politics." TBF board member John Brownlee added, "Russ had the ability, more than any of us, to see those unintended consequences in fisheries management."

He took complex issues and explained them so average people could understand them. As director of the MFC, Nelson was responsible for many controversial size and bag limits on popular species including red snapper, grouper, kingfish and red drum, some of which remain in place today, 26 years later. He guided Florida's contentious transition after passage of the 1994 net ban, which imposed limits on the nets used by commercial fishermen. He served for 14 years as a member of both the U.S. South Atlantic and Gulf of Mexico Fishery Management Councils that managed fish beyond state waters with their respective regions.

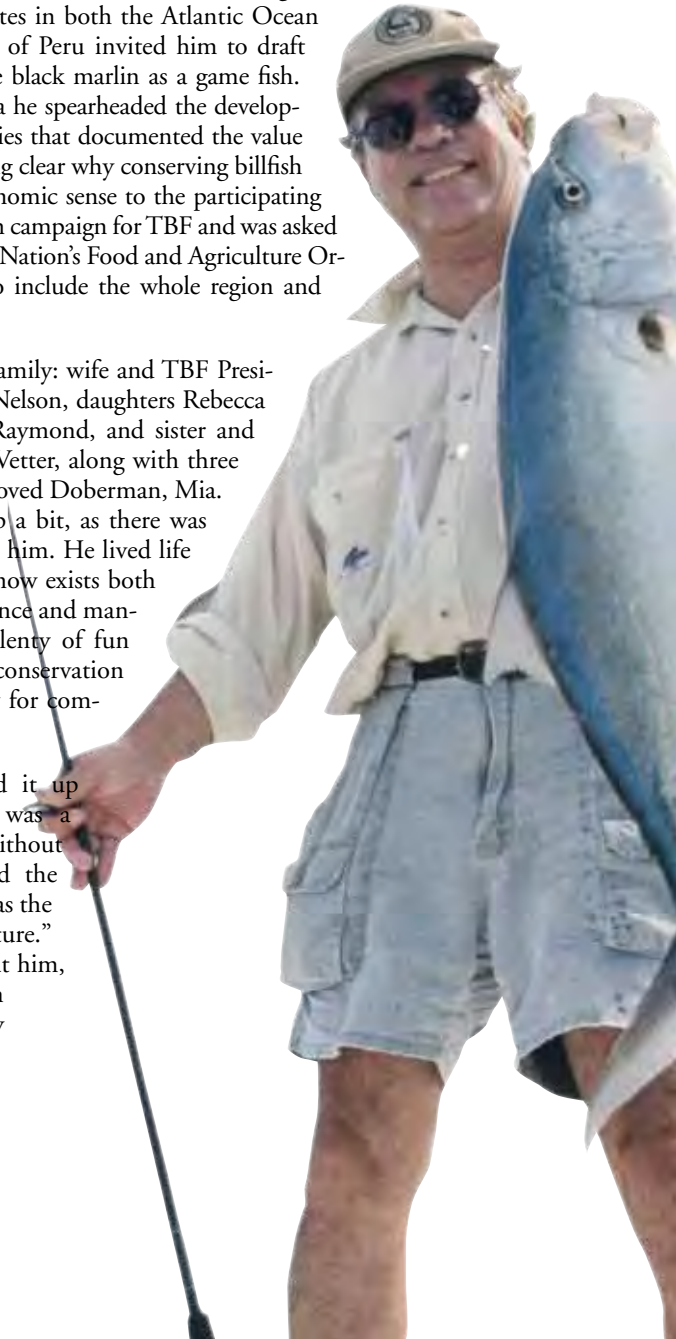

In 2001 Russell moved to South Florida, began his own consulting firm and joined the TBF team. He served on international negotiating delegations for the United States in both the Atlantic Ocean and Pacific Ocean. The President of Peru invited him to draft measures for the nation to manage black marlin as a game fish. In Mexico, Costa Rica and Panama he spearheaded the development of three socio-economic studies that documented the value of sportfishing tourism, thus making clear why conserving billfish and other species made strong economic sense to the participating nations. He was leading a Caribbean campaign for TBF and was asked by the World Bank and the United Nation's Food and Agriculture Organization to broaden the work to include the whole region and additional issues.

He was also passionate about his family: wife and TBF President Ellen Peel, his mother Ruth Nelson, daughters Rebecca and Kate, brothers Randall and Raymond, and sister and brother-in-law Barbara and Gary Vetter, along with three nephews, their families and his beloved Doberman, Mia. Nelson also liked to stir things up a bit, as there was nothing traditional or boring with him. He lived life with genuine gusto. A great void now exists both in his family and in the fishery science and management world, though he left plenty of fun memories and excellent marine conservation successes from which all can draw for comfort and wisdom.

Captain Bouncer Smith summed it up nicely when he said, "Russell was a visionary. We will never fish without him because Dr. Nelson formed the fishing that we have today as well as the fishing that we'll have in the future." The world is a lesser place without him, and so this 2013 Conservation Report is dedicated to the memory of Dr. Russell Nelson.

Editor's Note: Dr. Russell Nelson's inductions into numerous Halls of Fame this year illustrate how much he will be missed by conservation and sportfishing community.

TBF Team

| Ellen M. Peel, J.D., LL.M. - President |

Ellen manages and leads TBF's operations; coordinates development of conservation and management strategies with the Board of Directors, staff and consultants; provides media interaction; serves as the primary interface with the Board and conservation partners and represents TBF before all levels of fisheries management organizations. Contact Ellen at (954) 202-9267 or ellen_peel@billfish.org

| Peter Chaibongsai - Chief Science & Education Officer |

Peter oversees TBF's Tag & Release Program; manages TBF's International Tagging Grant program; researches marine policy issues; and assists in cultivating strategy with key conservation partners; oversees TBF's volunteer/intern program and provides educational and outreach assistance at special events. Contact Peter at (954) 938-0150 ext. 107 or peter_chaibongsai@billfish.org

| Andrew Cox - Chief Government Affairs Officer |

Andrew works closely with TBF President, Ellen Peel, on international and domestic fisheries management issues. He currently focuses the majority of his efforts towards U.S. Highly Migratory Species (HMS) and ICCAT related matters. Andrew also works extensively in TBF's Tag and Release Program, analyzing tag recaptures. Contact Andrew at (954) 938-0150 ext. 115 or andrew_cox@billfish.org

| Michael Kelly - Science & Policy Specialist |

Michael reviews the science and policy pertaining to the impacts of marine protected areas to the sportfishing industry; assists with TBF's Tag & Release Online Database; and provides angler outreach at tournaments and events. Contact Michael at (954) 938-0150 ext. 102 or michael_kelly@billfish.org

| Deborah Cummings - Membership Manager |

Deborah manages member services, recruitment, membership renewals, member outreach, the Chairman's Club and TBF merchandise. Deborah also cultivates membership at tournaments and special events. Contact Deborah at (954) 938-0150 ext. 106 or deborah_cummings@billfish.org

| Robert Jones - Chief Operating Officer |

Robert is responsible for all day-to-day accounting activities, monthly & annual financial reporting, budgets and annual audits; designing and enhancing internal controls and written standard operating procedures. For grant monitoring, Robert works with the President to assure that all grants and contracts meet required financial processes, systems and procedures; he is the main point of contact for grantee financial matters. Contact Robert at (954) 938-0150 ext. 113 or robert_jones@billfish.org

| Elizabeth Black - Management Assistant |

Elizabeth (Beth) Black serves as the primary contact between the President and the public through Board member contact, Foundation and fund raising liaisons as well as staff operations. Beth is also editor of TBF's *Billfish* publication. Duties include assisting President Ellen Peel with whom she cultivates strong development, marketing and constituent networks, but will also assist with the organization's program and operational needs. Contact Beth at (954) 938-0150 ext 104 or Elizabeth_black@billfish.org

| C. Phillip Goodyear, Ph.D. - Scientist |

Dr. Goodyear provides all of TBF's scientific analysis on population dynamics, catch data analysis and other statistical analyses needed for establishing a sound foundation for conservation and management strategies.

| Herbert Nanne - Conservation Director, South America |

Herbert serves as TBF's main representative in the Central American region, helping coordinate conservation and science activities; he also serves as a scientific counselor for Costa Rica before the Inter-American Tropical Tuna Commission (IATTC).

| Jackie Marsolais - Graphic Designer |

Jackie consults as the graphic designer and marketing consultant for TBF's advertising, graphic design and printing including *Billfish*, *Sailfish* and *Spearfish* magazines.

Tag & Release Program

Established in 1990, The Billfish Foundation's Tag and Release Program includes the largest private billfish tagging database with over 200,000 tag and release reports. TBF annually receives close to 10,000 - 12,000 tag and release records worldwide that provide vital information for billfish conservation.

The application of traditional tags from recaptured billfish provides valuable scientific data pertaining to growth rates, longevity, migratory patterns, habitat utilization and is used in stock assessments of billfish.

Tagging provides a means for important science contributions to be made by members of the recreational fishing community. The social and economic benefits derived from billfishing have become increasingly important in a world where longline by-catch represents the largest source of marlin mortality. Billfishing is compatible with sustainable use of marine resources and generates strong economic returns to communities.

REPORTING TAGGED AND RELEASED BILLFISH

- Submit the data online at www.tagbillfish.org
- Legibly fill out and mail the Tag Data Report Card to TBF
- Make sure to report the release date, species of fish, and location (latitude/longitude) of the release
- Measure or estimate the length and weight of the fish

In the case of recovering a tagged billfish, clip the monofilament off the original tag and, if possible, retag the fish.

If you have any questions about the Tag and Release Program or would like to purchase tags please go to our website at www.billfish.org, or contact us at tag@billfish.org or call (954) 938-0150.

TBF's Online Database - The Evolution of Conventional Tagging

One of the biggest accomplishments for TBF in 2013 was the complete redesign and overhaul of the Tag and Release Database (www.tagbillfish.org). The system is a very important tool for TBF's conservation and education efforts with the goal of increasing tagging efforts and engaging anglers, captains, and the general public around the world.

The system will serve as your 'digital logbook', allowing you to see and share ALL of your billfish tag and release records submitted to TBF. Once logged in, even as a new user, the system will try to match you with any of your historical catch records. If for some reason you don't see one of your records, this is more than likely due to an old address associated with your name and TBF can easily remedy the situation. Once everything is synced, you can look back and see your catch and release records, as well as share them via Facebook and Twitter.

The Interactive Map section on the database plots your historical catches, allowing you to see all of your catches plotted across the globe. Color-coded by species, you can click on any particular personal

record and see the catch details as well as any photos or video that you may have uploaded.

The Explorer section provides anyone complete access to all of TBF's tag and release records.

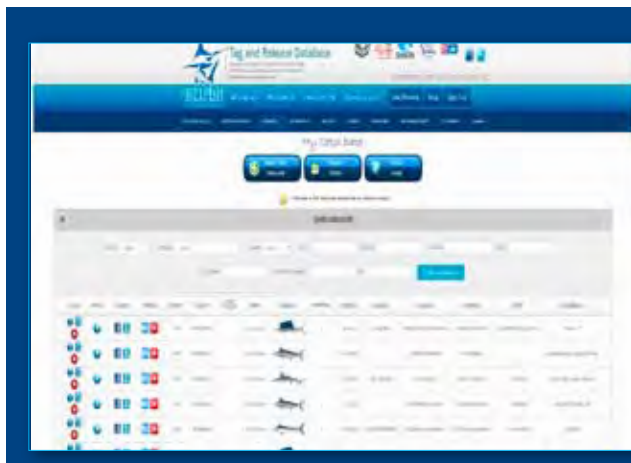

More than 200,000 tag and release billfish records are now completely transparent and ready to be explored. Sure to satisfy the curiosities of any angler or captain, it can also serve as a unique tool for students from elementary school to graduate school. The database creates basic reports and graphs with

information regarding tags, releases and recaptures of billfish. Queries can be built to virtually look up anything one could imagine. Graphs, reports, and even the raw data can be downloaded to further analyze or use for school reports and research projects.

Utilizing a feed from FishTrack, captains and anglers can use the Weather section to find detailed weather forecasts and other important oceanographic features including sea surface temperature (SST), currents, and tides customized for any location.

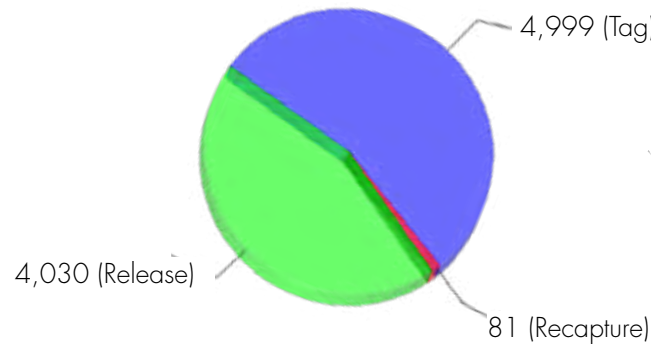

In addition to current uses of tag and release data, the new system provides a tool that expands educational opportunities for captains, anglers, and the next generation of billfish advocates. Instilling the fascination and interest today will make lasting impacts that will inspire them for years to come.

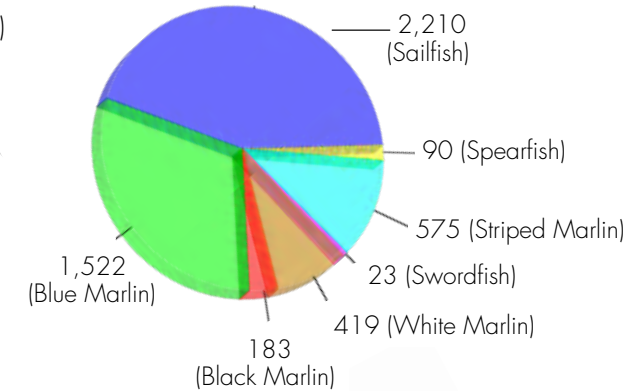

2013 Tag, Release & Recapture Data Summary

The Billfish Foundation received reports for 9,110 billfish released in the calendar year of 2013; 4,999 were tagged fish and 4,030 were released. The following pages summarize the recorded data by species, ocean and event. Overall, more fish were tagged and released in the Pacific than in the Atlantic Ocean. A large increase in reports from Cape Verde, Gabon, Mozambique, Seychelles, Malaysia, Dominican Republic, and Japan were received in part from TBF distributing tags in new and remote regions. The most commonly reported species was sailfish (5,024) and the least reported was swordfish (59). With the ever-increasing conservation ethic amongst billfish anglers, the use of circle hooks increased to 68.5% for fish reported with the type of hook used.

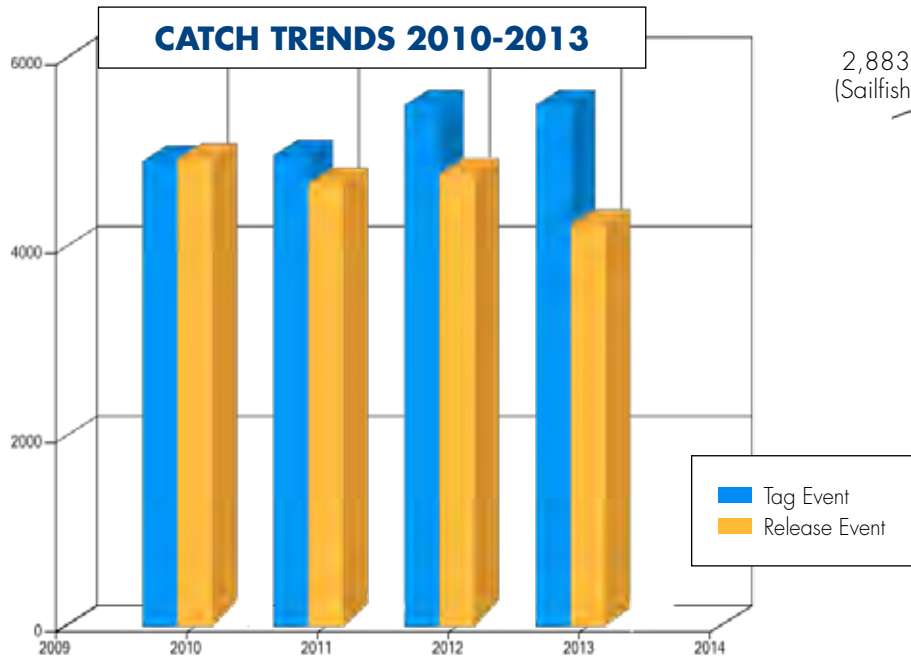

OVERALL CATCH SUMMARY

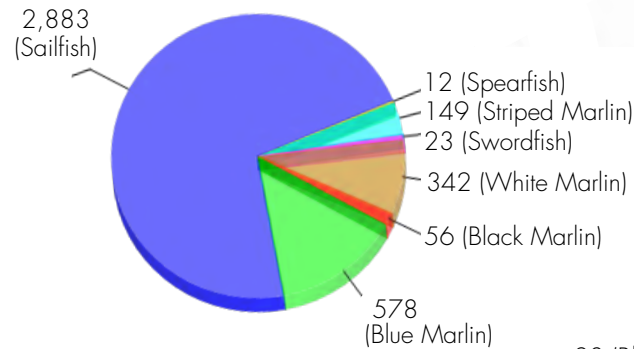

TAG BY SPECIES

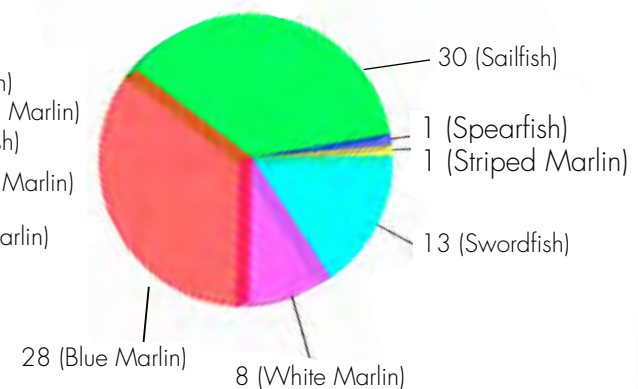

CATCH TRENDS 2010-2013

RELEASE BY SPECIES

RECAPTURE BY SPECIES

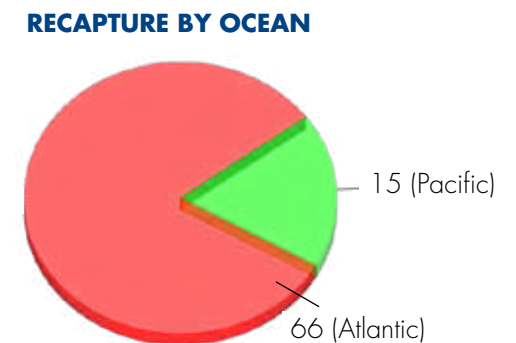

RECAPTURES - THE MOST IMPORANT PIECE OF THE PUZZLE

Over the duration of TBF's tagging program, TBF has the highest reported billfish recapture rate worldwide. In 2013 a total of 81 tagged billfish were recaptured, which raises the number of recaptured billfish to 2,879, over the life of the program. Of these, the species with the all time highest recapture rates are swordfish followed by white marlin and blue marlin.

When a fish is recaptured, the scientific loop of data collection is completed. Of the billfish recaptured in 2013, the longest time at-large was a sailfish that swam for 2,573 days (7 years), recaptured 72 miles (1,280 km) from where it was originally tagged. The longest distance between tagging and recapture locations in 2013 was a blue marlin tagged off of Kona, Hawaii and recaptured off of French Polynesia, 2,540 miles (4,088 km) away and 157 days later. The most commonly recaptured species of billfish in 2013 was sailfish (30), followed by blue marlin (28) and swordfish (13).

One of the greatest challenges when analyzing billfish recapture data is missing original tagging information. Failure to submit original tagging data creates a critical void that diminishes the value of the tagging. Please submit tagging data at the conclusion of each fishing trip to avoid a loss of critical data. Utilize TBF's online database at www.tagbillfish.org to report your billfish data.

TOP TAG & RELEASE LOCATIONS BY SPECIES

Three major oceans and nearly every continent were represented with top billfish reporting locations for 2013 thanks to the information reported by anglers and captains worldwide through TBF's online database. The push pins represent locations from which the most tagging reports were received.

BLACK MARLIN

1. Exmouth, Western Australia, Australia
2. Cairns, Queensland, Australia
3. Townsville, Queensland, Australia
4. Dampier, Western Australia,
5. Andaman Islands, India

BLUE MARLIN

6. Golfito, Costa Rica
7. Cape Verde
8. Japan
9. Casa De Campo, Dominican Republic
10. Cap Cana, Dominican Republic

SPECIES DATA

TBF's 2013 tag and release
data breakdown per species

BLACK *Marlin*

MAKAIRA INDICA

DISTRIBUTION:

Found in the tropical waters of the Indian and Pacific Oceans. Black marlin can be found in near-shore waters and around reefs, as well as the open sea in scattered numbers.

CHARACTERISTICS:

Black marlin are identified by their rigid "sickle-shaped" pectoral fins that are not retractable. The dorsal fin is considered to be the shortest of any of the billfish, less than 50 percent of the body size by height.

SIZE:

Female black marlin, as is the case for all billfish, are larger than males weighing on average 700 pounds, while the males weigh in around 300 pounds. Commercial longline boats have reported individuals weighing 2,500 pounds, and many over 1,000 pounds have been caught by anglers in the waters off Australia, Peru, Panama and Mozambique.

DIET:

Opportunistic feeders - squid and other pelagic fish.

LIFESPAN:

Mature at 2-4 years. Estimated to live as long as 27 years for females and 18 years for malest.

STATUS:

A formal assessment of black marlin stocks has never been completed for the whole Pacific; however, given dramatic declines in longline catches over the last thirty years, a Pacific-wide assessment must be a high priority. In the Indian Ocean catches are reported as stable; however, many scientists question the data and fishery pressures are on the rise.

COMMENTS:

Referred to as the "bull" of the sea, the black marlin has incredible strength and does not tire readily. Scientific analysis of their diets has shown that blacks feed in deep water as well as on the surface. Like many apex predators, they travel incredible distances.

TBF received 239 reports of BLACK MARLIN in 2013. Of those 183 were tagged and 56 were released without a tag. A majority of the effort for black marlin was based on both sides of Australia specifically in Exmouth, Cairns, Townsville and Dampier. Outside of Australia, another top location for black marlin was off the Andaman Islands.

CATCH SUMMARY

TAG BY OCEAN

RELEASE BY OCEAN

BLUE *Marlin*

MAKAIRA NIGRICANS / MAKAIRA MAZARA

DISTRIBUTION:

Found in offshore tropical and warm temperate oceans around the world.

CHARACTERISTICS:

Blue marlin are identified by pointed dorsal fins, pectoral and first anal fins. The pectoral fins are not rigid and can be retracted against the body. The lateral line is reticulated and can be difficult to see in larger animals.

SIZE:

Pacific blue marlin have been caught weighing over 2,000 pounds by commercial fisherman and up to 1,805 pounds have been caught on rod and reel. On average, blue marlin heavier than 300 pounds are female. Atlantic blue marlin average between 300 and 400 pounds. Typically, the largest blues are caught in the Pacific Ocean.

DIET:

Opportunistic feeders - squid and other pelagic fish.

LIFESPAN:

Mature at 2-4 years. Estimated to live as long as 27 years for females and 18 years for males.

STATUS:

Population levels of Atlantic blue marlin have plummeted over the past decades. Their levels are now estimated by scientists to be at 40% of what is considered a healthy population. In the Pacific, preliminary assessments have given conflicting results, but at best, Pacific blues are fully exploited. Catch reductions would greatly benefit stocks throughout the entire range of the species.

COMMENTS:

Blue marlin are renown for their strength, speed and aggressiveness, making them one of the most challenging of the billfish. They have been recorded making incredible journeys throughout the world's oceans. There is debate by scientists whether to recognize two separate but closely related species – *Makaira nigricans* in the Atlantic, and *Makaira mazara* in the Pacific and Indian Oceans.

CATCH SUMMARY

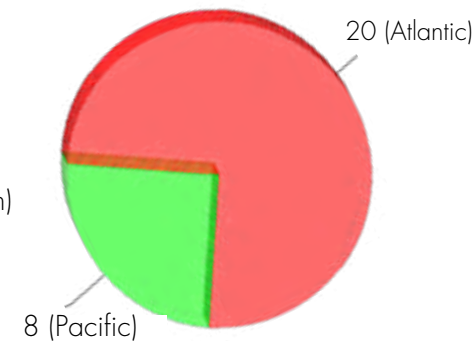

TAGS BY OCEAN

RELEASE BY OCEAN

RECAPTURE BY OCEAN

In 2013, TBF received 2,128 reports of BLUE MARLIN. Of those 1,522 were tagged and 578 were released without a tag. Surprisingly much of the tag & release effort for blue marlin was Pacific-based off Golfito, Costa Rica and Japan. In the Atlantic a great number of blues were tagged in Cape Verde and the Dominican Republic. A total of 28 blue marlin recaptures were reported this year and the longest time at large was 2,109 days or close to 6 years. The longest distance for a recaptured blue marlin was approximately 2,540 miles from Kona, Hawaii to French Polynesia in just 157 days.

Sailfish

ISTIOPHORUS ALBICANS* / *ISTIOPHORUS PLATYPTERUS

DISTRIBUTION:

Found in tropical and subtropical waters near land in all oceans of the world. Sailfish will travel alone or in groups along edges of reefs or current eddies. Sailfish seek out warm surface water and their migration patterns are tied to temperature changes of even a few degrees. In the Atlantic Ocean, sailfish can be found in high numbers in the Caribbean Sea, Gulf of Mexico, around the Florida shoreline and the West Indies. In the Pacific Ocean, sailfish are found in high numbers off the coasts of Panama, Costa Rica, Guatemala and Mexico.

CHARACTERISTICS:

Sailfish are easily identified by the long, high first dorsal fin for which it is so aptly named. The color of the "sail" is slate or cobalt blue with scattered black spots. The sides of the fish have pale, bluish gray vertical bars or rows of spots. The body is slender with a single lateral line.

SIZE:

The Indo-Pacific sailfish are the largest in size, averaging 100 pounds. Atlantic sailfish are much smaller, averaging 51 pounds and 5.5 feet long.

DIET:

Squid and other pelagic fish. Hunts alone or in groups using their sails to force schooling fish into tight "baitballs" on which to feed.

LIFESPAN:

Mature at 2-4 years. Estimated to live as long as 27 years for females and 18 years for males.

STATUS:

While eastern Pacific sailfish stocks appear healthy, extremely large harvests of sailfish off the coast of Africa may be jeopardizing stock abundance across the Atlantic.

COMMENTS:

Sailfish were the first to attract the attention of anglers. Today they are the most encountered and tagged of the billfish species. Like the blue marlin, scientists are debating whether to recognize two species of sailfish – *Istiophorus albicans* in the Atlantic and *Istiophorus platypterus* in the Indian and Pacific Oceans.

Illustration by Carey Chen

CATCH SUMMARY

TAG BY OCEAN

RELEASE BY OCEAN

RECAPTURE BY OCEAN

In 2013, TBF received 5,123 reports of SAILFISH worldwide. 2,210 were tagged sailfish and 2,883 were released sailfish without a tag. A majority of the tagging and release effort was reported off Guatemala, Mexico, Costa Rica and South Florida. One of the surprising things was the increased amount of sailfish tagged off Angola. A total of 30 sailfish were recaptured; the majority in the south Florida region. However, one of the recaptured sailfish was tagged off West Africa and travelled at least 1,600 miles from Angola to the island of Sao Tome.

Spearfish (* All four species)

TETRAPTURUS SPP.

DISTRIBUTION:

Found in the tropical and subtropical offshore waters in all of the world's oceans. Spearfish are found feeding near the surface.

CHARACTERISTICS:

Spearfish are identified by their slender and long body type, short bill and high dorsal fin similar to a marlin but lacking the height and length of a sailfish. Spearfish can be confused with white marlin, but are distinguished by looking at their scales which end in several points on tiny prongs.

SIZE:

Spearfish are generally small, measuring four to five feet in length.

DIET:

Squid and pelagic fish.

LIFESPAN:

Have the shortest lifespan of the billfishes, maturing at 2 years and living no more than 5.

STATUS: Spearfish are considered to be the rarest and least understood of all the billfishes. Little data exists on their stock status. In the Atlantic, roundscale spearfish are frequently lumped with white marlin in fishery reports and studies.

COMMENTS:

Scientists recognize several separate species of spearfish. Because of the low number of spearfish encountered and the difficulty in quick identification, TBF groups these species together when gathering tagging data. Spearfish represent the least widespread and least studied of billfish.

The most common species caught in the Atlantic is the roundscale spearfish whereas in the Pacific, the most common species is the shortbill spearfish.

CATCH SUMMARY

TAGS BY OCEAN

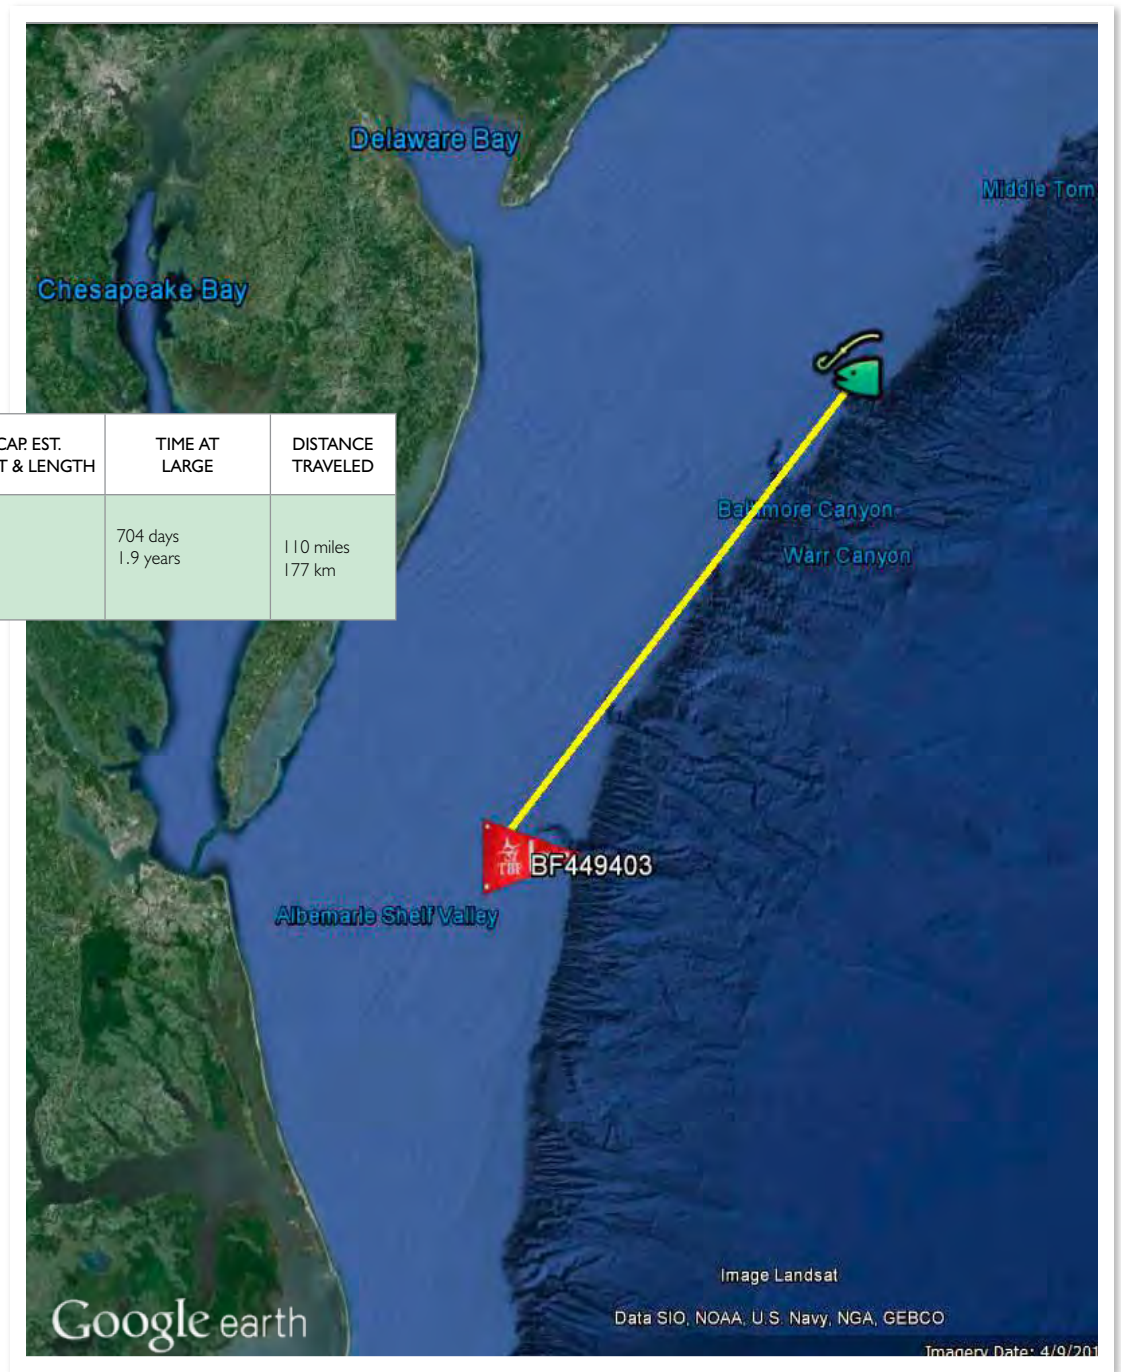

RELEASES BY OCEAN

*Recaptures only in the Atlantic

In 2013, TBF received 103 interactions with SPEARFISH, with only 90 tagged, 12 releases, and 1 recapture. While the Pacific was the leader in spearfish encounters (specifically Hawaii), TBF did have some reports from locations like Japan and Cape Verde. We had one recapture in 2013 off of Wilmington Canyon and was at large for over 2 years.

BF449403	A: Andy Harris C: Andy Morris September 24, 2011 Norfolk Canyon, Virginia Beach, VA		A: Chris Roosevelt August 28, 2013 Wilmington Canyon, Ocean City, MD TYLER M	80 lbs 36 kg	704 days 1.9 years	110 miles 177 km

STRIPED *Marlin*

TETRAPTURUS AUDAX

DISTRIBUTION:

Found widely distributed in the tropical and warm temperate waters of the Pacific and Indian Oceans. High numbers are reported in the eastern and north-central Pacific, as compared with the western Pacific. Also, plentiful in the waters of the Indian Ocean and the western Arabian Sea. Striped marlin feed on the ocean surface or in mid-water depths.

CHARACTERISTICS:

Striped marlin are identified by their high, pointed first dorsal fins, which on average equals or exceeds the body depth. They have the highest dorsal fin of all the marlin species. These stripes can "light up" with greater intensity. Scientist theorize this is used in communication when hunting in groups.

SIZE:

Striped marlin range from 125 pounds to 483 pounds. Although not the biggest of the billfish, most of the largest individuals have been reported off the coasts of Chile and New Zealand.

DIET:

Opportunistic feeders - squid and other pelagic fish.

LIFESPAN:

Mature at 2-3 years. Estimated to reach an age of 10 years.

STATUS:

A recent assessment was done on a new stock definition that splits the former North Pacific striped marlin stock into two stocks: the Western Central Pacific Ocean (WCPO) stock and the Eastern North Pacific stock. According the most recent report for the WCPO, the stock is currently depleted and currently experiencing overfishing. If separate northern and southern stocks exist, the northern group may be overfished.

COMMENTS:

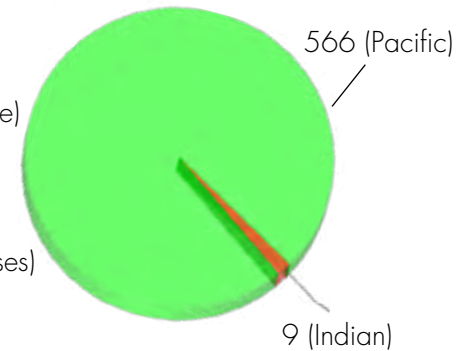

Striped marlin are the acrobats of the billfish world leaping and "grey-hounding" across the water when hooked. Tagging data shows striped marlin to be highly migratory, moving back and forth toward the equator in response to the cold and warm seasons. In 2002, a striped marlin was tagged off of Costa Rica and over 3 years later was recaptured off Cabo San Lucas by Timothy Pawlowski and Jesus Perez, traveling almost 2000 miles!

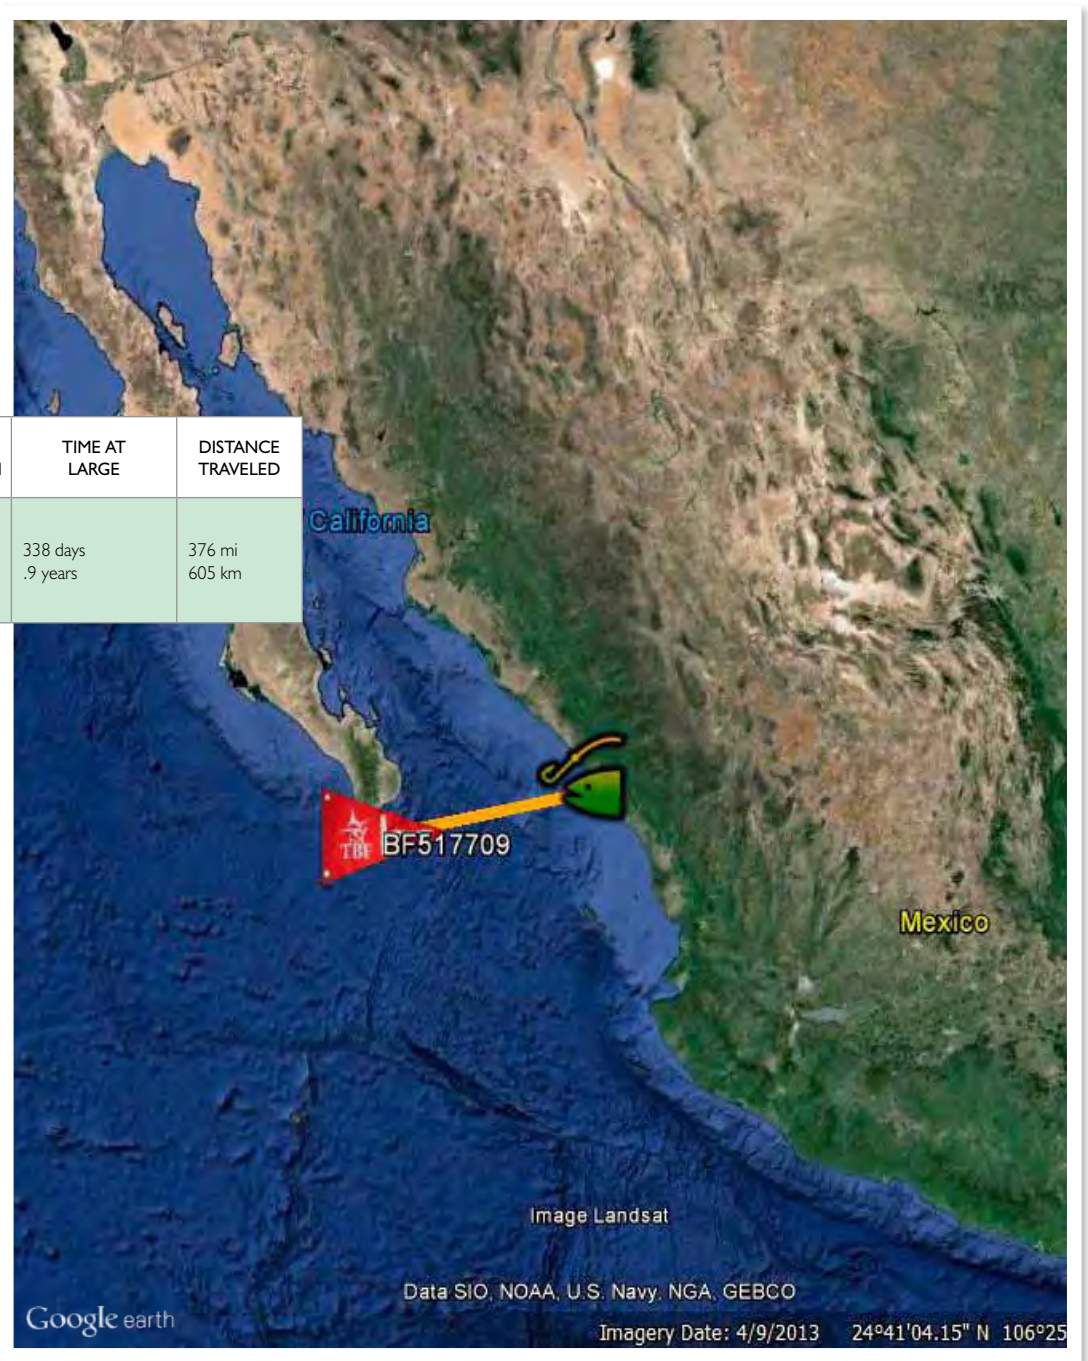

CATCH SUMMARY

TAGS BY OCEAN

TBF received reports of 575 tagged STRIPED MARLIN and 163 released without a tag. A large portion of the tag and release effort was based off of the Baja California Sur region but other top destinations included Japan and Mozambique. There was one recaptured striped marlin, off Mazatlan, Mexico that was tagged originally off Los Cabos.

Swordfish

XIPHIAS GLADIUS

DISTRIBUTION:

Found in temperate and tropical waters throughout the world's oceans. Swordfish have a vast range and were once considered common.

CHARACTERISTICS:

Swordfish, also called broadbill, are identified by their very broad, flattened "sword" that is longer and wider than those of the other billfishes. The color of the body varies from metallic purple-blue to a black-blue, or sometimes a bronze tone becoming lighter on the sides, and on the ventral a silvery gray-white.

SIZE:

On average swordfish weight between 251 and 350 pounds with fish over 300 pounds tending to be female. In the western Atlantic they have been caught up to 700 pounds and up to 1,182 in southeastern Pacific.

DIET:

Opportunistic feeders - squid, pelagic fish, and other cephalopods.

LIFESPAN:

Females estimated to mature at 4-5 years, males at 3-4 years; living up to 9 years on average.

STATUS:

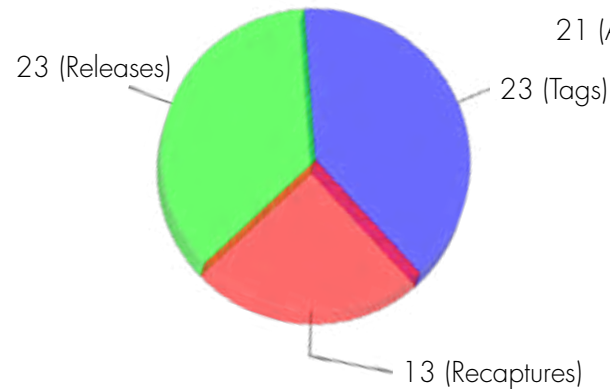

With the advent of longlining, swordfish experienced a steep decline. After 10 years of domestic and international restrictions on commercial fleets, the north Atlantic stock has fully recovered.

COMMENTS:

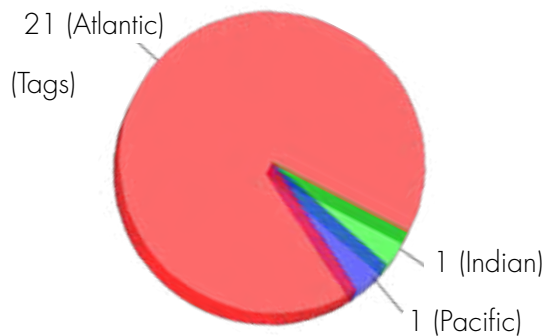

Most group swordfish with the marlins and sailfish under the name billfish, because each has a long, spear-like extension of their upper jaw (a bill). In fact, the swordfish's resemblance to a marlin is superficial, since it lacks pelvic fins and scales and has a flattened rather than a round bill. Although all billfish share a common ancestor, the swordfish split off from the other billfishes millions of years ago, and belong to the family *Xiphiidae*; the other billfish are members of the family *Istiophoridae*. The swordfish is difficult to locate and highly migratory. The species also has the greatest range of temperature exposure of any other billfishes with adults preferring cooler waters except for spawning. Swordfish also have a tremendous depth range, giving them the ability to feed at great depths. Their large blue eyes aid the billfish in its deep sea environment.

In 2013, TBF received 23 tag reports and 23 SWORDFISH releases. Most of the effort was based in the North Atlantic in South Florida and the Gulf of Mexico but the top spot was in New Zealand. There were 13 recaptured swordfish, all originally tagged in south Florida with recapture locations such as Canada and Cuba. The longest distance traveled was about 2,100 miles from Palm Beach, Florida to the Mid-Atlantic Ridge and the longest time at large was over 4.5 years.

WHITE Marlin

TETRAPTURUS ALBIDUS

DISTRIBUTION:

Found in deep tropical and temperate waters throughout the Atlantic Ocean, including the Gulf of Mexico, the Caribbean Sea and the western Mediterranean Sea. White marlin stay near the surface and follow the seasonal warm water patterns.

CHARACTERISTICS:

White marlin are distinguished from all other billfish by their rounded first dorsal fin, pectoral fins and first anal fin. Their color is light, showing more green than other marlins. Light blue or lavender vertical bars may show on the sides when the fish is active. Dark blueblack to purple spots are scattered throughout the first dorsal and anal fins which are light lavender blue.

SIZE:

On average the white marlin is generally 40 to 60 pounds, with weights up to 180 pounds having been recorded. The largest fish are typically reported off the coast of Venezuela.

DIET:

Squid and pelagic fish.

LIFESPAN:

Estimated to live as long as 18 years.

STATUS:

Stocks are reported to be at all time lows; however, anglers have been reporting signs of a slight improvement. The most recent assessment indicates a slight upswing in their abundance.

COMMENTS:

White marlin compete with the striped marlin for the most acrobatic title. Whites can dance and "tail-walk" for long distances giving a strong fight for the smallest of the marlin species. White marlin can reach the age of ten; they spawn in late spring and early summer.

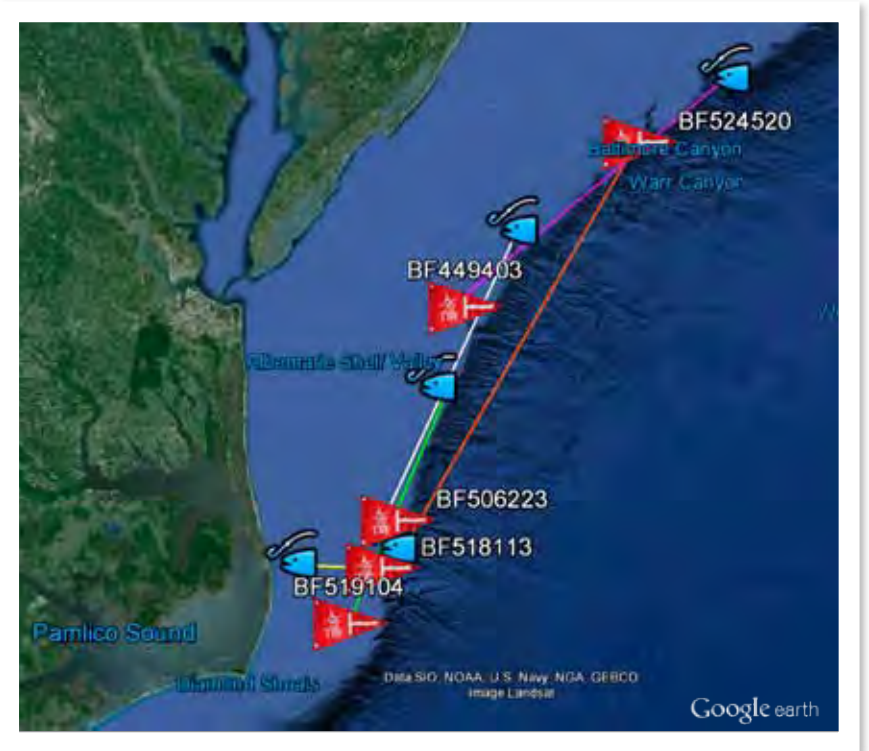

CATCH SUMMARY

* Atlantic Only

A total of 769 WHITE MARLIN were reported to TBF in 2013. Of those 419 were tagged and 342 were released without a tag. A majority of the tag and release effort was located in the Northern Atlantic, specifically in the Mid-Atlantic region. A large number of reports also came from Morocco and the Dominican Republic. TBF received 8 white marlin recapture reports. The majority of the recaptures were in the Mid-Atlantic region, with one reported from Venezuela. One of the recaptured white marlin was originally tagged off Ocean City, MD and recaptured in the middle of the Atlantic ocean 2.5 years later and more than 1,800 miles from where originally tagged.

BLUEFIN *Tuna*

THUNNUS THYNNUS

Since 1990 the valuable data contributions made by the sportfishing community are well documented at TBF and by other scientists. Dr. Molly Lutcavage, Director of the Large Pelagic Research Institute at the University of Massachusetts-Amherst, her work featured in National Geographic and in the New York Times, is one of those scientists. She established a Research Partnership with TBF, for collecting the much needed tagging data on juvenile bluefin tuna by creating the Tag-A-Tiny™ project. The project enlists anglers and charter captains to report the data, which is included in TBF's Tag and Release Data Base. Thus far over 1,400 tagged small bluefin tuna have been from the program to TBF, which has generated important recaptures, including multiple trans-Atlantic records. Several of these fish were at large for 5 years and grew over 300-400 pounds. Tag a Tiny™ program helped engage the recreational fleet, and established a US reporting network for ICCAT-linked bluefin projects. Since 2005 LPRC scientists also deployed over 247 electronic tags on juvenile bluefin, providing the first fishery-independent understanding of their year-long migrations and habitat use. With the continued growing international scrutiny placed on juvenile Atlantic bluefin tuna, LPRC's research and additional data collection grows in importance for the United States.

GROWING TRENDS *in Circle Hook Use*

The use of circle hooks began not as a regulation, but as a tool for conservation initiated within the sportfishing community. In 2008, non-offset circle hook usage was mandated during tournament fishing in the U.S. when a natural, combination or live baits were used to target billfish. However, prior to the regulation, the trends in circle hook usage began to grow and have substantially become the more prominent hook type used within TBF's tag and release records – the trend is catching on!

CIRCLE HOOK BASICS

- Circle hooks, as their name implies, have a circular appearance where the point of the hook is perpendicular to the hook shank. This is in comparison to the traditional "J" hooks where the point is more or less parallel to the hook shank. These hooks have become a conservation tool for billfish by benefitting the fish and the angler by making successful hookups easier.

Circle hooks also increase the post-release survival rate of billfish.

When circle hooks are used with live or dead bait, particularly in a 'drop back' fishery,

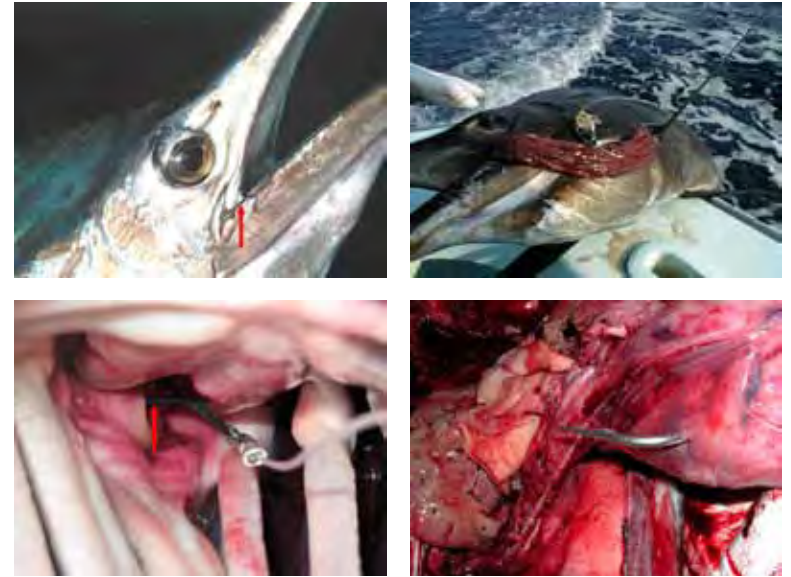

Photo courtesy of NOAA

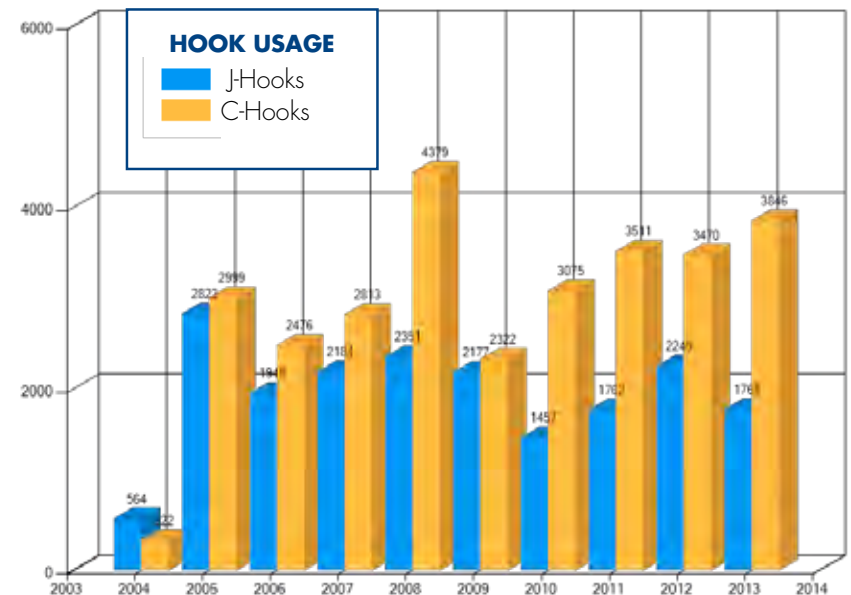

the vast majority of fish are hooked somewhere in the corner of the mouth due to the hook shape and the feeding mechanics of billfish. Since the point of the hook is pointed inward, the hook can freely move internally without snagging vital areas before reaching the hard jaw. This results in minimal bleeding and no damage to internal organs. However, when J hooks are used with this same type of 'drop-back', a very high percentage of the fish are hooked in undesirable locations such as the gills, throat, or stomach because the point of the hook is not facing towards the shank of the hook. This subsequently reduces the post-release survival of the fish.

TBF encourages the use of 'in-line' (non-offset) circle hooks. Many hooks are labeled circle hooks, but are offset and actually cause damage similar to that of J hooks.

TBF is excited to continue to work with conservation partners to expand the use of circle hooks in new locations while also increasing the education of anglers and captains on the importance of using circle hooks as a conservation tool....they might find their hook-up percentages will actually go up!

Top left: Circle hook in corner of fish's mouth. Top right, bottom left and right are examples of J hook use.

TBF *Annual Tag & Release Competition*

You can participate in TBF's Annual Tag & Release Competition by becoming a member of TBF and promptly turning in your Tagging Data Report cards. The competition runs from November 1st through October 31st of the following year.

CATEGORIES

OVERALL - Awards are presented to the top overall anglers within each division, along with top captains who tag and/or release the most fish during the competition year.

TAGGING - Captain and angler awards are presented to those who tag the most of each billfish species in each ocean with a 5 fish minimum required.

RELEASE - Captain and angler awards are presented to those who release, without tagging, the most of each billfish species in each ocean with a 5 fish minimum required.

LADY: Awards are presented to the lady anglers who tag and/or release the most billfish.

MATES: TBF recognizes the valuable contribution of mates in both the release and tagging of billfish through our Mate Recognition Program, a cumulative, on-going program that awards mates with a pair of Costa Sunglasses and a plaque for his or her level of achievement. Mate awards are given on a yearly basis for the Atlantic, Pacific and Indian Oceans.

YOUTH ANGLER - Awards are presented to anglers under 18 years old (as of the end of the competition) who tag and/or release a minimum of 3 fish within five age range categories. Anglers birth dates must be included on each card or online submission.

COMPETITION DATES:

November 1- October 31 of the following year.

DEADLINE: All Tagging Data Report and Release Notification Cards must be received by TBF no later than November 15.

ELIGIBILITY: Anglers, captains and mates *MUST* be a current TBF member to receive an award based on their submitted Tagging Data and Release Data Cards. Regardless of membership, all data from each submission is valuable for billfish research. You can check your membership status by registering with TBF's online tag and release database or by calling (954) 938-0150 ext. 106.

IMPORTANT NOTE: Online entry of data at tagbillfish.org assures timely submission. If you wait until the end of the competition year to send in your cards, you run the risk of not having your cards reach TBF by the deadline.

***PLEASE NOTE:** Fish that are tagged and released are NOT counted in the Release Category. These fish are only counted in the Tagging Category.*
